Be sure to This manual Gain acquaintance with all parts and Always light and use the stove with caution. This could cause Let the stove cool prior to priming and lighting again. A hot stove Instead, release The VaporAF is NEVER mix fuels. When changing fuels, NEVER fill bottles near a lit stove, an open flame, a lit cigarette or NEVER store fuel bottles or flammable materials near a stove in Other manufacturers fuel bottles may not seal the pump Avoid frequent clogging by using clean, fresh, high quality fuel. DO NOT light or use the Leaks must be repaired prior to lighting or using the stove. Turn control handle counter clockwise for desired output. The conductor ribs of the Please note White gasoline needs shorter priming time due Do not hold any part of your body above the Turn off, fully after about two seconds. The fuel will prime the burner. When priming flame is Stop pumping once firm resistance on the The VaporAF is intended for outdoor cooking only, and is not designed for use with large capacity cookware. If you have any problems with your VaporAF, the stove should be returned to the dealer or sent to Brunton, 2255 Brunton Court, Riverton, WY 82501 U.S.A. It may not display this or other websites correctly. You should upgrade or use an alternative browser. Got it at a decent price from Moontrail. First and foremost, heres a flame shot The burner design is somewhat unique. It only has one jet for all fuels. The outer burner cup can be twisted left or right, changing the air intake openings of the inner bell. Twist left for liquid fuels, twist right smaller openings for Gas. The flame spreader is held in place by a spring, making it very easy to remove, but also to get lost. The three swivel pot rests fold out to form a wide and stable base, and are held together by a hinge above the burner. This makes the contraption very sturdy and stable, but restricts access to the jet.<http://adrijaadrika.com/userfiles/carrier-infinity-touch-owners-manual.xml>

I am afraid it will also prohibit the use of a silent cap, unless a very slim one is made. The fuel hose is flexible, and attaches to the pump with a standard gas canister thread presumably compatible with Primus and other pumps. There are two valves main valve near the pump, and simmer control on the burner. The pump is plastic, similar to the MSR grey pump. I primed with alcohol there is a priming pad, but the burner was still not hot enough when the alcohol burned out. Priming sort of continued with some liquid fuel squirting out and generating soot, but soon things stabilized and I got a beautiful, strong blue flame with only some hints of yellow. There is more yellow in the flame when you turn it down to simmer. This is one big advantage over the XGK. I hate the spilling of fuel from the fuel line of an XGK when I disconnect it, especially when I use the foul smelling kerosene. All in all, I feel this is an excellent stove, although I still have to give it more use. I dont use my stoves in extreme conditions low temp, high altitude, so I cannot compare it with the aces in these environments. Yup, mine works a treat with all types of fuel and the only thing to adjust is sliding from gas to liquid on the feedtube although I did not notice much difference. RonIs there a reason you cant use the flip stop on your XGK HJThe MSR pump has a tab that locks the metal block from rotating. In order to flip the tank, you have to unlock the retaining clip and pull the fuel line some 3 mm out of the pump. I am concerned that the tank pressure may cause the fuel line to shoot out of the pump. Is this a false concern YonadavYou should find you can flip the bottle without any of those gymnastics. That being the case you cant rotate the fuel line, but you can rotate the entire stove, if you can be bothered holding it. They all have it. Only the XGKEX has a flexible line.<http://www.demenagements-remond.fr/userfiles/20200905145729.xml>

Will the XGK burn upside down? It works well however it pays to be careful with MSR fuel lines as they are not sold separately. Not a problem if you live in the US, as MSR will fix it cheaply but over here in the cheap seats you are looking at DIY repair or replacing the entire burner unit in the unlikely event of a fuel line failure. Doc Mark pointed out to me sometime ago an old set of instructions for the XGK, or GK solid fuel line. They said to simmer, turn off the stove so the flame goes out, flip the entire thing, turn on the stove to release pressure out the jet. Turn it back over and relight it. I tried it and found it a bit smelly on kero. Does this work this the stove lit. I am 99% sure I tried it and it did work. I do not have a XGK now so can't try again. I can't see why it would not work. Running a Primus pump and adapter for liquid fuel burning Coleman in photo. KM. I Wish I Knew I mentioned that I spent a lot of time looking for uniquely flexible and unusual items. In response, they suggested that I review their Vapor AF expedition stove. According to Brunton, this stove could burn just about any liquid or gas fuel. Anything from gasoline and kerosene to butane and jet fuel is usable in this stove. Of course I had to do the review. I mentioned that I spent a lot of time looking for uniquely flexible and unusual items. In response, they suggested that I review their Vapor AF expedition stove. Of course I had to do the review. Weighing in at 16oz. This doesn't include the aluminum fuel bottle which adds some bulk but not a significant amount to the weight of the whole package. The stove and bottle, while appearing light and flimsy to the eye, have a sturdy feel that is important to camping trips where conditions may not be the best. The stove seemed both solid and well constructed and I decided to test this with a make shift durability assessment I threw it down a flight of concrete steps three times.

Aside from a few scratches, the stove was unharmed and still functioned properly. The folded stove is shown below. The grid is made up of 1" squares to provide scale. The legs unfold easily but this is where the ease of use ends. Given my experience with both last month's review and this one, Brunton seems to have the market cornered on providing THE WORST INSTRUCTIONS IN THE WORLD. The double-sided page of instructions was hard to understand and gave ambiguous directions that were difficult to follow. It was provided in both English and French, but neither made assembly or operation of the stove clear. Intent on managing the technical troubles, I spent two full days tinkering with the stove and finally unraveled its secrets. I shudder to think at the time wasted had I been trying to figure this out for the first time in the woods. The stove had two settings, one for butane and one for liquid fuels. The included bottle could be used for liquid fuel with one setting, or a butane canister could be attached and used with the other. According to the instructions, the stove supported the following fuels butane, white gasoline, kerosene, diesel fuel, jet fuel, and auto fuel but indicated that one should NEVER use fuels other than those listed. My curiosity was intrigued and I felt a second test was in order. By my reasoning, specific fuel types may not always be the easiest to come by in a remote backwoods location, but there is one product that has and always will be readily available in any area booze. With that assumption, I decided that my fuel of choice would be rum. Concerned that the 80 proof variety might be insufficiently combustible, I hastened to my liquor cabinet and pulled out the strongest bottle I had 151 proof. I have over 40 years experience backpacking, beginning with the Svea 123 and later the MSR 9a stove. Since those days, I've used every MSR stove made as well as numerous stoves of other brands.

One end of the slit is stamped with the letter G for gas and the other end is stamped with the letter L for liquid. Just rotate the fuel cup until the control valve is resting against one of the two letters, depending on your fuel choice. Maintenance of the stove body is very simple. It only requires cleaning of the burner jet occasionally. There is no shaker needle inside the burner jet so you have to clean the jet manually with a pricker supplied with the stove. It is long and easy to hold so it can be maneuvered even with gloves quite easily. There is a slight variation in this stove in that the third arm does not clamp tightly around the burner cup. Instead it extends outside the inner burner cup and attaches to a permanently mounted spring retainer on one stove leg. That holds it firmly in place during use, but also allows quick detachment if you have to remove the flame spreader to get at the

burner jet. A multitool is supplied with the stove that acts as a screw driver if you actually have to remove the burner jet for cleaning. Other than that, there is a screw on the bottom of the stove which will allow for complete disassembly of the stove body. They are serrated on top to help retain cookware that has ribbed bottoms. The outside diameter of the circle described by the outside edges of the three legs is 8 inches so the stove is steady even on unlevel ground and will hold pots of up to about 12 inches in diameter with no unsteadiness. The fuel pump is constructed of a sturdy plastic that looks considerably more robust than the plastic MSR pumps that I've dealt with for years. It's also much more maintenance friendly. Rotating it about a quarter turn will allow you to remove the plunger from the pump. Unlike most other pumps, there is no leather cup to keep lubricated at the bottom of the plunger. Instead there is an enlarged portion of the plunger which holds an O-ring that rides against the sides of the plunger well.

This design is inherently more efficient than the old pump-leather design and can move more air at a higher pressure. It is the same design as used with the piston for the Katadyn Pocket water filter that lasts for years and years and has a lifetime warranty. Lubricate that O-ring with a little grease or vaseline every year or two and you should have plenty of pumping power. Removing that screw with the supplied multitool will give you access to the in-pump fuel filter if you need to replace it. It also gives you access to a couple other O-rings that are a part of the attachment point that the fuel line screws into. Turn the burner cup to select gas or liquid fuel. Screw fuel line onto pump for liquid fuel or canister for gas fuel. If using liquid fuel, pump 20-25 times to pressurize fuel bottle. Open fuel valve. If liquid fuel, wait two seconds for fuel to run into burner cup, then turn off. Ignite fuel and wait for stove to preheat. When fuel is almost burned up, open fuel valve. If gas fuel, just ignite and turn fuel valve to desired flame. Just hold a match or lighter to one of them and the fuel will ignite without you having to get your hand near the top of the burner cup where you might get burned. Turning off the stove is a matter of just shutting off the fuel valve if burning gas. If burning liquid fuel, turn the fuel bottle over and the fuel pump will use the remaining pressure in the fuel bottle to pump air through the fuel line into the stove effectively clearing the stove and fuel line of fuel and turning off the stove and simultaneously relieving the pressure in the fuel bottle without having to unscrew the pump from the bottle and getting sprayed with fuel in the process. Fuel may be safely carried in the bottle with the fuel pump in place since there is a check valve inside the pump assembly that prevents the leakage of fuel if the stove and fuel line are detached from the pump.

I tend to use stoves at full throttle so haven't really tried to simmer yet and can't speak to this stove's ability to do that. However, using gas fuel, simmering is theoretically possible even using a roarer-type burner. The sack has an interior zippered pocket to carry the supplied stove instructions and the small repair parts kit that comes with it. The repair parts kit includes the multitool, the jet pricker, an extra fuel bottle O-ring, extra pump plunger O-ring and extra O-rings for the fuel line attachment points and two extra fuel filters. The stove also comes with a foil windscreen similar to those provided with MSR liquid fuel stoves except the foil this windscreen is made from is much heavier than its MSR counterparts. It is somewhat more difficult to bend into a round shape for use, but it is heavy enough so that it doesn't get blown around by the slightest breeze and therefore performs its function much better than its MSR counterparts. That includes all of the above maintenance parts that already come with the stove plus an extra multitool, flame spreader, fuel jet, jet pricker, grease to lubricate the O-rings, extra fuel inlet tube for the pump, extra air tube for the pump and replacement wicks for the burner cup. Easy to use with great simmer control. I only have used white gas and purchased it so that I could do some real cooking on the trail besides boiling water. It can go from jet engine fast to a low simmer with no problems. It is durable. I did have a Whisperlite which I had used for 20 years, but it had only one speed, jet engine fast. This was on sale and I liked that you could use a multiplicity of fuels and that you could simmer with it. It will go from jet engine hot to a low simmer with just a turn of the knob. It is ideal if you want to do more than boil water. The construction is very durable. Sorry to see it discontinued, but I am glad that I have

mine. I pulled it out, prelit the stove and then fired her up. It worked just like new.

No leaks and would go from a low simmer to jet engine fast. Ill take the pump apart again tonight and coat the Orings with silicone grease again and I think that should allow me to keep it for awhile longer. It can use a multiplicity of fuels including gas, but my fuel of choice is white gas. It just is like brand new and with proper care. I think that it should last until I cant backpack anymore. Glad to hear your stove is still working well. 3 years ago Was impressed by the claim of adapting from liquid fuel to canister fuel with the twist of the ring surrounding the burner assembly. What the advertising hype does not tell you is that with the exception of the conversion from liquid to canister fuel a trick which the Primus Himalaya Omnifuel has been able to do since 1998 this stove is a significant step down from the Nova and from the Primus Himalaya. Specifically, the fuel pump is primarily plastic, with a very flimsy plastic plunger. The fuel lines which attach to the pump and sit inside the fuel bottle can easily be pulled out with your fingers. There is no cover on the pump inlet valve to keep dirt, water, etc. Oh yes, the threaded brass inlet valve is surrounded by a plastic screwdown assembly. All in all, this stove may be new, but it is certainly not better than its predecessor or its competition. Rather, it seems like an attempt to save on manufacturing costs while living on the reputation of the Nova. Click OK to extend your time for an additional 0 minutes. In Hilal Dandan R, Brunton LL. McGrawHill; Accessed August 17, 2020. APA Citation General anesthetics and therapeutic gases. Hilal Dandan R, Brunton LL. General anesthetics have low therapeutic indices and thus require great care in administration. The selection of specific drugs and routes of administration to produce general anesthesia is based on their pharmacokinetic properties and on the secondary effects of the various drugs, in the context of the proposed diagnostic or surgical procedure and with the consideration of the individual patients age, and associated medical condition.

The causes include direct vasodilation, myocardial depression, or both; a blunting of baroreceptor control; and a generalized decrease in central sympathetic tone. Agents vary in the magnitude of their specific effects, but in all cases the hypotensive response is enhanced by underlying volume depletion or preexisting myocardial dysfunction. Therefore, ventilation generally must be assisted or controlled for at least some period during surgery. The gag reflex is lost, and the stimulus to cough

is blunted. Lower esophageal sphincter tone also is reduced, so both passive and active regurgitation may occur. Endotracheal intubation has been a major reason for a decline in the number of aspiration deaths during general anesthesia. Muscle relaxation is valuable during the induction of general anesthesia where it facilitates management of the airway, including endotracheal intubation. Neuromuscular blocking agents commonly are used to effect such relaxation see Chapter 11 . Alternatives to an endotracheal tube include a face mask and a laryngeal mask, an inflatable mask placed in the oropharynx forming a seal around the glottis. MHE Privacy Center.
